

## SOUTHERN CORDILLERA REAL

*Tiquimani, New Route.* In August, 1997, Spaniard Pere Vilarasau soloed the imposing Tiquimani in an impressive five hours round-trip. The 5519-meter mountain northeast of Huayna Potosí (misnamed Cerro Illampu on the IGM maps) has seen few ascents in recent years due to increasingly thin conditions. From a camp ten minutes from the face, Vilarasau climbed 50° scree to a 100-meter mixed (V 80-90°) section to reach a 50°, then 70-80° section to the col on the ridge. He then followed the ridge to the summit with one abseil before the last 100 meters (III) up to the summit. He descended the same route. The snow and ice were good, but the rock was very poor.

## CHILE

## CENTRAL ANDES

*Tupungato, South Face.* It was reported that on January 6, 1997, Christiane Herrmann, Olaf Hollik and Frank Kostrovn climbed the south face of Tupungato (ca. 6550m), a popular high volcano in the Central Andes. The line (40-50° snow) may or may not have been new. (*High Mountain Sports* 190)

*Cerro Giobbi and Cerro Centinela, First Ascents.* I decided to take a sabbatical to guide young climbers to unexplored mountain ranges and to give them, in practical terms, some of the climbing forces that drove us in the 1960s.

In January, 1997, we went with the climbers of the Club Alpinista Paulista (Brazil) to southern Chile. The chosen range was located close to an unknown and never-visited fjord 100 miles southeast of Puerto Eden, a village on Wellington Island. Base Camp was destroyed twice by big waves and icebergs coming from a huge icefall half a mile away. Some of us had to sail back to a nearby, more protected shore to fix the damage to the boat's hull made by the ice.

In spite of the weather conditions, we succeeded in climbing, alpine-style, two virgin summits: Cerro Giobbi (1650m), located at 49° 57' 36" S and 73° 49' 27" W, and Cerro Centinela (1450m), located at 49° 57' 22" S and 73° 49' 48" W. Both of them rise straight up from sea level. Centinela was climbed on January 27, 1997, and Giobbi on February 3.

The area is impressive for its climbing potential, weather conditions, glacial activity and difficult access and retreat. We were also able to locate Cerro Gariota (ca. 2600m), a fantastic unclimbed rock and ice pyramid north of Penguin Fjord.

After the climbs, we began to pull out from the area, but were locked in by 15 miles of icepack. After getting ashore and reinforcing the hull with wood, anchor and old tires, we spent two days pushing against the ice to reach the Icy Channel. Sailing north, we arrived at Puerto Eden days later.
